

Merge Interval

Leetcode Problem 56

Problem Description

Given an array of intervals where $\text{intervals}[i] = [\text{start}_i, \text{end}_i]$, merge all overlapping intervals, and return an array of the non-overlapping intervals that cover all the intervals in the input.

Constraints:

- $1 \leq \text{intervals.length} \leq 104$
- $\text{intervals}[i].\text{length} == 2$
- $0 \leq \text{start}_i \leq \text{end}_i \leq 104$

Example:

Input:

- $\text{intervals} = [[1,3],[2,6],[8,10],[15,18]]$

Output:

- $[[1,6],[8,10],[15,18]]$

Algorithm - A Clever Sorting Trick

1. Sort the array on the first element
2. Add the first element to the result
3. For all remaining elements in the sorted array, compare the start element of the element to the end of the most recent result
 - a. **Case 1:** If they overlap, replace the most recent result element with the max end of the two elements
 - b. **Case 2:** Otherwise, add the new element to the result list

Algorithm - Time Complexity

1. Sort the array on the first element
2. Add the first element to the result
3. For all remaining elements in the sorted array, compare the start element of the element to the end of the most recent result
 - a. **Case 1:** If they overlap, replace the most recent result element with the max end of the two elements
 - b. **Case 2:** Otherwise, add the new element to the result list

Algorithm - Time Complexity

1. Sort the array on the first element
2. Add the first element to the result
3. For all remaining elements in the sorted array, compare the start element of the element to the end of the most recent result
 - a. **Case 1:** If they overlap, replace the most recent result element with the max end of the two elements
 - b. **Case 2:** Otherwise, add the new element to the result list

Let's code it!

Algorithm - Time Complexity

1. Sort the array on the first element
2. Add the first element to the result
3. For all remaining elements in the sorted array, compare the start element of the element to the end of the most recent result
 - a. **Case 1:** If they overlap, replace the most recent result element with the max end of the two elements
 - b. **Case 2:** Otherwise, add the new element to the result list

Algorithm - Time Complexity

1. Sort the array on the first element $O(n \log n)$
2. Add the first element to the result
3. For all remaining elements in the sorted array, compare the start element of the element to the end of the most recent result
 - a. **Case 1:** If they overlap, replace the most recent result element with the max end of the two elements
 - b. **Case 2:** Otherwise, add the new element to the result list

Algorithm - Time Complexity

1. Sort the array on the first element
2. Add the first element to the result
3. For all remaining elements in the sorted array, compare the start element of the element to the end of the most recent result
 - a. **Case 1:** If they overlap, replace the most recent result element with the max end of the two elements
 - b. **Case 2:** Otherwise, add the new element to the result list

$O(n \log n)$

Note: This can depend, but I'm using Java's `Arrays.sort(...)` in Java 8 which is duval-pivot quicksort

Algorithm - Time Complexity

1. Sort the array on the first element $O(n \log n)$
2. Add the first element to the result $O(1)$
3. For all remaining elements in the sorted array, compare the start element of the element to the end of the most recent result
 - a. **Case 1:** If they overlap, replace the most recent result element with the max end of the two elements
 - b. **Case 2:** Otherwise, add the new element to the result list

Algorithm - Time Complexity

1. Sort the array on the first element $O(n \log n)$
